

Project 2 Response

TEAM: HALWAYLISM

<https://crooksnwhiskey.github.io/3Dproject/>

This 3D project is very interesting. At first, I felt very immersed, it is not only a static webpage, but a space that changed with user interaction. This made the experience more fun and be deeply rooted in people's minds.

Also, this project added background music, making the experience more immersed. It strengthens tension and enhances the sense of immersion. The music and 3D visual work together making the interaction more complete. It is not just a visual experience but also a multisensory interaction experience. I really enjoyed this interaction process.

For me, the most surprising part is that the project uses Three.js to create a web-based 3D interactive space. The whole system include scene, camera and WebGL renderer, through these basic modules made a 3D environment rendered in real time.

From an interaction perspective, the project used PointerLockControls realize first person perspective control, allowing user to move using the keyboard and control the view with the mouse. This design making the experience more immersive.

The code also implements a relatively complex game mechanic. For example, it uses a Ratcaster to detect whether the user clicks on specific button, which can trigger

actions such as removing walls `removeWall` or changing the game progression. This indicates that the space is designed as a multi-stage environment with a level-based structure.

Besides, the scene includes multiple 3D model loaded using `GLTFLoader`, like camera model, column and exit symbol, these elements strengthen space enhances realism and narrative quality. At the same time, lighting (`PointLight+AmbientLight`) and fog effects are used to create a sense of pressure and immersion.

From a visual design perspective, the CSS also plays an important role in shaping the user experience. For example, the crosshair is placed at the center of the screen, which support the first-person perspective and helped guide user interaction. The play button is also to centered, making the interface more visually focused and providing a clear starting point for users.

In addition, the broke-away mechanism is hidden, and only appears under specific conditions providing interaction feedback. The typeface and spacing also help create a game like atmosphere. Overall, the CSS supports both function and visual design making the project more immersion and interactivity.

An interesting part is that the button positions are randomly generated using `Math.random()`. Because the structure is random, it changes slightly each time the experience is opened. This makes the interaction less fixed and more exploration.

Overall, this project is not just a 3D web project. But an interactive experience combining interaction, spatial storytelling, and simple game elements.

From my view, this project helps me understand how, visual design and interaction work together to create a complete experience. It is not just about making somethings look good. But also, more about caring about users feeling and reactions during the process. It made me realize the importance of integrating technology and design thinking. This project also interaction, visual and technique in digital. It also helped me understand how interaction and design cooperate to shape user experience.
